To whom it may concern:

This letter is to inform you that the above patient had eye surgery for:

To repair the macular hole, torn or detached retina, the vitreous is removed and replaced with a gas bubble. The bubble rises and applies pressure to the area in need of healing. Since the macula is at the back of the eye, the gas bubble will only work if the patients head is position faced down. The real challenge for the patient is dealing with the monotony, stress, and discomfort of a 23 hour a day face down position postoperative, usually for a 1-to-2-week period. It is medically necessary for the patient to use face down equipment (chair) for this recovery to obtain the maximum visual results following their eye surgery.
